AMENDMENTS

Amendments to the Claims

The below listing of the claims replaces all prior versions and listings of claims in this application.

Listing of the Claims

1. (Original)   A system for processing an input signal, the system comprising:

- an adaptive predistortion subsystem for receiving said input signal and for producing a predistorted signal by applying a deliberate predistortion to said input signal;

- a signal processing subsystem receiving and processing said predistorted signal and producing a system output signal;

- a feedback signal processing subsystem for receiving and processing a feedback signal derived from said system output signal; and

- a delay subsystem for providing a delay to a replica of said input signal to produce a delayed signal, said delayed signal being sued by said predistortion subsystem and said feedback processing subsystem,

wherein

- said predistortion subsystem distorts said input signal to compensate for distortions in said system output signal;

- said signal processing subsystem decomposes said predistorted signal into separate components, each of said separate components being processed separately;

- said processing subsystem combines said components after processing to produce said system output signal;

- an output of said feedback processing subsystem being used by said adaptive predistortion subsystem;

- said deliberate predistortion applied to said input signal by said adaptive predistortion subsystem to produce said predistorted signal is adjusted based on characteristics of said system output signal and said input signal.

2. (Original) A system according to claim 1 wherein said signal processing subsystem

comprises:

- a signal decomposer for decomposing said predistorted signal into at least two

components;

- at least two signal component processor blocks, each signal processor block receiving

an output of said signal decomposer and each signal processor block separately processes

said output received from said signal decomposer; and

- a combiner receiving a processed output from each of said at least two signal

component processor blocks, said combiner producing said system output signal from

said processed outputs of said at least two signal component processor blocks.

3. (Original) A system according to claim 2 wherein at least one of said at least two signal

component processor blocks includes an amplifier.

4. (Original) A system according to claim 3 wherein said amplifier is a non-linear amplifier.

5. (Original) A system according to claim 1 wherein said system is part of a signal transmission

system.

6. (Original) A system according to claim 1 wherein at least some of said distortions are due to

said combiner.

7. (Original) A system according to claim 3 wherein said amplifier is a switch mode amplifier.

8. (Original) A system according to claim 3 wherein said amplifier has a low output impedance.

9. (Original) A system according to claim 1 wherein said deliberate predistortion includes

magnitude distortions which adjust a magnitude of said input signal.

10. (Original) A system according to claim 1 wherein said deliberate predistortion includes phase distortions which adjust a phase of said input signal.

11. (Original) A system according to claim 1 wherein said deliberate predistortion is based on at least one entry in a lookup table.

12. (Currently amended) A method of processing an input signal to produce a system output signal, the method comprising:

a) receiving said input signal;

b) applying a deliberate predistortion to said input signal to result in a predistorted signal;

c) decomposing said predistorted signal into at least two component signals;

d) combining said at least two component signals to produce said system output signal;

e) adjusting said deliberate predistortion based on said characteristics of said system output signal

f) concurrent with steps b) -e), executing the following steps:

f1) delaying a replica of said input signal;

f2) diverting a diverted replica of said system output signal to a feedback path;

f3) processing said diverted replica to produce a corrected version of said diverted replica; and

f4) determining said deliberate predistortion using said corrected version and said delayed replica of said input signal.

f4) determining said deliberate predistortion using said corrected version and said replica of said input signal.

13. (Original) A method according to claim 12 wherein said system output signal is an RF modulated version of said input signal.

14. (Original) A method according to claim 12 further including a processing step of separately processing each of said at least two component signals prior to step d).

15. (Original) A method according to claim 14 wherein said processing step includes amplifying at least one of said at least two component signals.

16. (Original) A method according to claim 14 wherein said processing step includes phase modulating at least one of said at least two component signals.

17. (Original) A method according to claim 12 wherein step a) further includes the step of accessing an entry in a lookup table, said deliberate predistortion being based on said entry.

18. (Original) A method according to claim 17 wherein said deliberate predistortion is based on an interpolation of entries in said table.

19. (Original) A system according to claim 1 wherein said predistortion subsystem receives a replica of said system output signal.

20. (Original) A system according to claim 2 wherein said deliberate predistortion is dependent on differences between said input signal and said replica of said system output signal.

21. (Original) A system according to claim 11 wherein entries in said lookup table are periodically updated based on characteristics of a replica of said system output signal.

22. (Original) A system according to claim 11 wherein said deliberate predistortion is based on an interpolation of entries in said table.

23. (Original) A system according to claim 1 wherein said predistortion subsystem includes:
    - determining means for determining said deliberate predistortion;
    - adjustment means for applying said deliberate predistortion to said input signal;
    - update means for periodically updating said determining means based on characteristics

of said system output signal.

24. (Original) A system according to claim 23 wherein said adjustment means receives

parameters of said deliberate predistortion from said determining means.

25. (Original) A method according to claim 12 further including the step of taking a difference

between said replica of said input signal and said diverted replica of said system output

signal to determine said characteristics of said system output signal.

26. (Original) A method according to claim 17 further including the step of updating at least

one entry in said table.

27. (Currently amended) An adaptive predistortion ~~subsystem~~ system for use with a signal

processing system which produces a system output signal, the predistortion ~~subsystem~~

system comprising:

- decomposition means for decomposing an input signal into two or more components;

- determining means for determining a deliberate predistortion to be applied to each

signal component ~~an input signal~~;

- adjustment means for separately applying said deliberate predistortion to each signal

component ~~said input signal~~;

- a combiner which combines each signal component to form an output signal;

- update means for periodically updating said determining means based on characteristics

of said system output signal;

wherein said adaptive predistortion system ~~subsystem~~ uses

- an output of a delay subsystem for delaying ~~said input signal~~ each signal component and

- an output of a feedback processing subsystem for processing a feedback signal derived

from said system output signal to determine said deliberate predistortion.

28. (Currently amended) An adaptive predistortion system ~~subsystem~~ according to claim 27 wherein said adjustment means receives parameters of said deliberate predistortion from said determining means.

29. (Currently amended) An adaptive predistortion system ~~subsystem~~ according to claim 27 wherein said determining means comprises a lookup table having entries, said entries being used to determine said deliberate predistortion.

30. (Currently amended) An adaptive predistortion system ~~subsystem~~ according to claim 29 wherein said determining means further comprises interpolating means for determining values not found in said lookup table.

31. (Currently amended) An adaptive predistortion system ~~subsystem~~ according to claim 27 wherein said deliberate predistortion is dependent on differences between said input signal and ~~said replica~~ a replica of said system output signal.

32. (Original) A system according to claim 1 wherein said delay subsystem comprises:
    - a plurality of delay elements;
    - means for sampling said input signal;
    - means for storing samples of said input signal;
    - means for selecting selected samples of said input signal; and
    - means for combining said selected samples of said input signal.

33. (Original) A system according to claim 1 wherein said delay subsystem comprises separate subsystems for separately delaying a magnitude and a phase of said input signal.

34. (Original) A system according to claim 1 wherein said feedback signal processing subsystem comprises means for adjusting a phase of a replica of said system output signal.

35. (Original) A method according to claim 12 wherein said processing in step f3) comprises adjusting a phase of said diverted replica based on said input signal.

36. (Original) A method according to claim 12 wherein said processing in step f3) comprises adjusting a magnitude of said diverted replica based on said input signal.

37. (Currently amended) An adaptive predistortion system ~~subsystem~~ according to claim 27 wherein said delay subsystem comprises:

- a plurality of delay elements;
- means for sampling ~~said input signal~~ each signal component;
- means for storing samples of ~~said input signal~~ each signal component;
- means for selecting selected samples of ~~said input signal~~ each signal component; and
- means for combining said selected samples of ~~said input signal~~ each signal component.

38. (Withdrawn) A method of initializing a phase correction to be applied to a feedback signal, said feedback signal to be used in determining a deliberate predistortion for a signal processing system, the method comprising:

a) initiating a coarse delay search

b) selecting a time window of W samples of said feedback signal and an input signal with a predetermined sample delay increments of 8 between samples

c) calculating an inner product P_a by performing a complex multiply and accumulate process for the W samples in the time window

d) storing a maximum $|P_\delta|$ found

e) repeating steps c) and d) for subsequent time windows and incrementing a by a predetermined amount for each time window

f) repeating steps b) - e) for a fine delay search using fractional sample increments to cover a predetermined delay range, said delay range being centered on a maximum delay increment δ_{max} found during said coarse delay search.

39. (Withdrawn) A method according to claim 38 wherein said inner product process is defined by

$$P_\delta = A_{MAC} \cdot \sum_{k=n \cdot W}^{n \cdot W + W - 1} \exp(j \cdot (\angle x_\delta(k) - \angle z(k))) \; where$$

$$\angle x_\delta(k) is \; a \; phase \; of \; said$$

input signal

$\angle z(k)$ is a phase of said feedback signal

A_{MAC} is a constant

n is an integer denoting a time window

40. (Withdrawn) A method according to claim 38 wherein said phase correction is a phase of said maximum P_δ.

41. (Withdrawn) A method according to claim 36 wherein said magnitude is adjusted by multiplying said diverted replica by $A_{,,}(k)$ where

$A_{sx}(k+1) = A_{sx}(k) + \mu_A \cdot (|x_\delta(k)| - A_{sx}(k)| - A_{sx}(k) \, |z(k)|)$

For $k_A \leq k \leq k_A + W_A - 1$

where

k_A = commencement time for magnitude adjustments

W_A = number of samples for which adjustments are performed

μ_A = update step size and $0 \leq \mu_A \leq 1$

$x_\delta(k)$ is said input signal

$z(k)$ is said feedback signal

42. (Withdrawn) A method according to claim 35 wherein said phase is adjusted by applying a phase correction to said diverted replica, said phase correction being initialized by a method for initializing a phase correction to be applied to a feedback signal, said feedback signal to be used in determining a deliberate predistortion for a signal processing system, the method comprising:

a) initiating a coarse delay search

b) selecting a time window of W samples of said feedback signal and an input signal with a predetermined sample delay increments of δ between samples

c) calculating an inner product P_δ by performing a complex multiply and accumulate process for the W samples in the time window

d) storing a maximum $|P_\delta|$ found

e) repeating steps c) and d) for subsequent time windows and incrementing δ by a predetermined amount for each time window

f) repeating steps b) - e) for a fine delay search using fractional sample increments to cover a predetermined delay range, said delay range being centered on a maximum delay increment δ_{max} found during said coarse delay search.

43. (Withdrawn) A method according to claim 12 wherein said deliberate predistortion is at least partially based on characteristics of said system output signal.

44. (Withdrawn) A method according to claim 43 wherein said deliberate predistortion is determined in an interactive manner during transmission of said system output signal.
